

## Maximum Productivity

The 1007NT from Great Plains combines a 10 foot planting width with a transport width of 10'. It is a 4-wheel design that improves maneuverability in turns. The unit pivots around the front wheels and the rear casters swing out shortening the turning radius. It also utilizes a floating hitch that pivots vertically, improving the unit's ability to flex up and over terraces and uneven ground.

All the features that you have come to expect from Great Plains have been incorporated into this model. The coulters are pre-loaded to 450 pounds to ensure proper penetration even in the toughest conditions. Our double disc configuration and full length seed tube ensures that the seed is placed consistently at the depth chosen. Additional seed tubes are used to place both optional native grass and small seeds. This allows three seeds to be planted at separate rates at the same time. Depth control and trench closing is handled by the 18 position T-handle depth gauging press wheels. The ground drive system automatically disengages when lifted.

Since all 4 tires carry the unit, the hitch is allowed to "float" providing excellent ground gauging ability.

## FEATURES & BENEFITS

**POSITIVE GROUND DRIVE** - Large diameter spring loaded drive wheel connected to a 4-speed gearbox creates a no-slip drive.

**SKID-STEER TIRES** - 4 tough, large diameter skid-steer tires provide excellent flotation and ground gauging. All wheels are in-board of the box creating narrow transporting of the machine.
